

1. Motivation: assessing effectivity of urban methods

Hypothesis:

- nature based solutions is necessary.

Is this executable?

Example: replacing old water sewage system.

- How do we assess how trees contribute to human well being?

One needs a way to assess the value attained. We put this into three aspects.

- (1) Biophysical and ecological.
- (2) Economic and financial.
- (3) Social and cultural, see 2.

The latter two are often less studied. Local climate $\left| \begin{array}{c} \text{green space cover} \\ \text{temperature} \end{array} \right|$

2. Metrics for well-being

There are several metrics used by current researchers.

-

Now what?
